Hydrates are named by the ionic compound followed by a numerical prefix and the suffix “ -hydrate. ” The “ $\cdot n\text{H}_2\text{O}$ ” notation indicates that “ n ” (described by a Greek prefix) number of loosely bonded water molecules are associated per formula unit of the salt. An anhydride is a hydrate that has lost water.

There are specific rules to follow for writing formulas of and naming inorganic hydrates. Because the water molecules aren't part of the compound's actual structure, this affects the way chemical formulas of inorganic hydrates are written. An example of a hydrate formula is $\text{CaCl}_2 \cdot 2\text{H}_2\text{O}$.

Chemistry: Hydrates Flashcards | Quizlet

The ionic compound (without the waters of hydration) is named first by using the rules for naming ionic compounds (e.g., $\text{Ba}(\text{OH})_2 \cdot 8\text{H}_2\text{O}$ = "barium hydroxide"). Rule 2. Greek prefixes are attached to the word "hydrate" to indicate the number of water molecules per formula unit for the compound (e.g., $\text{Ba}(\text{OH})_2 \cdot 8\text{H}_2\text{O}$; 8 water molecules = " octa hydrate").
