This article develops a comprehensive framework for environmental management accounting (EMA) linking business actors and EMA tools. The proposed framework provides structure for managers to understand and assess the variety of environmental management accounting tools that have been developed to date, with the intention of encouraging their adoption.

In previous work (Andersson and Sotiropoulos, 2015, Andersson and Sotiropoulos, 2016, Andersson et al., 2016) we have described a framework for the simultaneous correction of susceptibility- and eddy current-induced distortions as well as gross movement and signal loss caused by subject movement. We have argued for incorporating all of these effects into a comprehensive model since this is how they originate, and any attempt at a sequential correction strategy is bound to be inferior.

Towards a Comprehensive Framework for Adaptive Delta Management . By M. Marchand and F. Ludwig. Abstract. Deltas are dynamic landforms at the boundary of land and sea, involving intricate mazes of rivers and small waterways, wetlands, estuaries and coastal barrier islands. They are home to over half a billion people.

Assessing Progress Toward Sustainability: Development of a Systemic Framework and Reporting Structure. Ph.D. (interdisciplinary) Dissertation (School of Urban Planning, Faculty of Engineering, McGill University, Montreal).

Basic requirements for a reuse characterization scheme. State-of-the-art reuse characterization schemes. Model-based reuse characterization schemes. Applying model-based reuse characterizarion schemes. A reuse-oriented software environment model. Conclusions.

Over the last two decades, computer modeling and simulation have evolved as the tools of choice for the design and engineering of dynamic systems. With increased system complexities, modeling and simulation become essential enablers for the design of new systems. Some of the advantages that modeling and simulation-based system design allows for are the replacement of physical tests to ensure product performance, reliability and quality, the shortening of design cycles due to the reduced need for physical prototyping, the design for mission scenarios, the invoking of currently non-existing technologies, and the reduction of technological and financial risks. : Traditionally, dynamic systems are modeled in a monolithic way. Such monolithic models include all the data, relations and equations necessary to represent the underlying system. With increased complexity of these models, the monolithic model approach reaches certain limits regarding for example, model handling and maintenance. Furthermore, while the available computer power has been steadily increasing according to Moore's Law (a doubling in computational power every 10 years), the ever-increasing complexities of new models have negated the increased resources available. Lastly, modern systems and design processes are interdisciplinary, enforcing the necessity to make models more flexible to be able to incorporate different modeling and design approaches.
